

# Steroid APIs:

## *Pfizer's World-class Bioconversion Process*

**P**fizer CentreSource relies on proprietary technical expertise in early-stage bioconversion operations at the world's largest steroid manufacturing plant in Kalamazoo, Michigan, in the United States. Pfizer's unique process utilizes soybean-derived sterols and proprietary fermentation processes to create a very broad intermediate platform. This approach allows the economical production of four basic steroid intermediates, each at extremely large scale in one process step – something that takes many other steroid manufacturers numerous chemical steps to achieve from a different basic starting material.
